Test Certificate for Materials according to EN 10 204 / 3.1C Prüfbescheinigung für Werkstoffe entsprechend EN 10 204 / 3.1C

Ordered by: Kvaerner Warnow Werft GmbH

Besteller

Manufacturer: Mecklenburger Metallguß GmbH, Waren/Müritz

Hersteller

Order No.: A 992027

Bestell-Nr.

Work's Ref.No.: 600685.001

Werks-Nr.

Item: Solid propeller

Prüfgegenstand

Test requirements: Rules for materials of Germanischer Lloyd, edition 1998, chapter 5, section 1

Material designation: G-Cu Al 10 Ni

Werkstoffbezeichnung

according to: Customer's
entsprechend specif. and DIN 1714

Manufacturing process and heat treatment: Mould casting

Herstellung und Wärmebehandlung

Lieferumfang

Item Pos.	Pieces Stück	Description Gegenstand	Sheet No. Blech Nr.	Heat No. Schmelzen-Nr.	Test piece No. Probe-Nr.
1	1	Keyless solid propeller ready machined according to drawing No.: 91.1034-6700:01 approved by Germanischer Lloyd with journal No. 38944/01 dated 15/05/01. Propeller for KWW, Yard No. 027 Diameter: 6700 mm Geometric mean pitch: 6702 mm Direction of rotation: righthanded Number of blades: 6 Ice Class: E Propeller seat checked by means of male gauge. Bearing surface of the conical propeller bore amounts to appr. 80%.		7826/1 7826/2	7826/1/1 7826/1/2 7826/2/1 7826/2/2

Inspection:

Besichtigung

Static balancing test as well as dye penetrant check carried out and found satisfactory.

The requirements were complied with. Die gestellten Anforderungen sind erfüllt.

Date of testing: 17/01/02

Prüfdatum

Total weight:

31000 kg

Gesamtgewicht

Place and date: Rostock, 17th January, 2002

The design shown in this drawing is the property of Mecklenburger Metallguss GmbH and may not be used in any way without written consent of the owner.

- ① stucked with LOCTITE245
- ② sealed with O-ring
- ③ closed with closing screw/socket set screw after assembly
- ④ adapted after push-up

information (propeller assembly)

17.6mm push-up distance at 17°C
acc. to calculation of keyless fitting
push-up diagram
see draw.: 94.1034-6700:01, no.2

propeller cap

description for use LOCTITE245
for securing of the
hexagon head screw (pos. 6)

to put a snake in the bottom of thread
to screw the hexagon head screw in the thread

propeller cap - after assembly:
* checked at tightness
* filled with grease, tallow or the like

PROPELLER ASSEMBLY

<i>item</i>	<i>assembly-step</i>	<i>remark</i>
1.	check the surfaces of shaft cone and propeller hub cone for cleanness and slightly oil film. removing of burrs and points of impact.	<u>oil</u> : hydraulic oil
2.	set up the propeller on the shaft cone.	attention : no damage the surfaces
3.	put on the thrust ring and ring piston pump on the shaft journal.	
4.	assemble the divided clamp ring on the shaft journal.	see draw.: 90.1034-6700:01,no.2 (part: "before push-up")
5.	connect the hydraulic pump with the ring piston pump.	vent the ring piston pump before push-up.
6.	assemble the dial gauge for the push-up distance. reset the dial gauge at zero point.	consider the max. possible stroke of ring piston pump.
7.	assemble the contact thermometer to the propeller and shaft. both materials should be have a same temperature.	consider the necessary time for the stabilisation of the temperature of propeller and shaft.
8.	push-up the propeller without expanding on the shaft cone only by the ring piston pump (dry condition). → start point.	start point pressure = abt. 50bar
9.	determine the actual push-up distance δ_{act} corresponding with the measured temperature	see draw.: 94.1034-6700:01,no.2 - $\delta_p \Rightarrow \delta_{act}$ Only the actual push-up distance δ_{act} gives the right position of the propeller !
10.	connect the hydraulic pump with the injection hole of propeller hub.	use the mid hole for venting.
11.	reset the dial gauge at zero point.	begin of push-up (oil condition).
12.	pump oil for expanding the propeller hub.	close the vented hole if all air is bled.
13.	by continuous pumping of oil it will produced an oil film between the surfaces of connection until the oil comes out at both end of propeller hub cone. → friction between the surfaces is very small.	
14.	push-up the propeller by pumping the oil in the ring piston pump (axial pressure) and propeller hub (expanding pressure)	
15.	measure the pressures in steps with push-up distance δ_{act} about 2,0mm. continuous measuring of the push-up distance.	note in the draw.: 94.1034-6700:01, no.3
16.	after arriving the push-up distance δ_{act} - take down the expanding pressure gradually. open the oil connection of propeller hub slowly. the position of propeller must not change - check by the dial gauge.	allowable deviation of push-up distance $\Delta\delta_{act} = +0,1\text{mm}$ consider, that the propeller settle for a period of approx. 30 min.
17.	reduce the axial pressure gradually. disassemble the clamp ring, ring piston pump and thrust ring. the position of propeller must not change - check by the dial gauge.	<div style="border: 2px solid black; padding: 5px; display: inline-block; font-weight: bold; font-size: 1.2em;">OFFICIAL</div>
18.	turn the clamp ring and determine the distance between clamp ring and propeller. adapt the spacer according to the measured distance.	
19.	assemble the adapted spacer and the clamp ring. secure the connecting bolts of clamp ring.	see draw.: 90.1034-6700:01,no.2 (part: "after assembly")

PROPELLER DISASSEMBLY

<i>item</i>	<i>disassembly-step</i>	<i>remark</i>
1.	disassemble the clamp ring and spacer.	
2.	assemble the thrust ring, ring piston pump and clamp ring.	just as item 3.-4. ("propeller assembly")
3.	first pumping oil in the ring piston pump until striking increase of pressure	pressure= abt. 50bar
4.	pumping oil for expanding the propeller	
5.	the propeller slides from the shaft cone, simultaneously the pressure in the ring piston pump is reduced.	

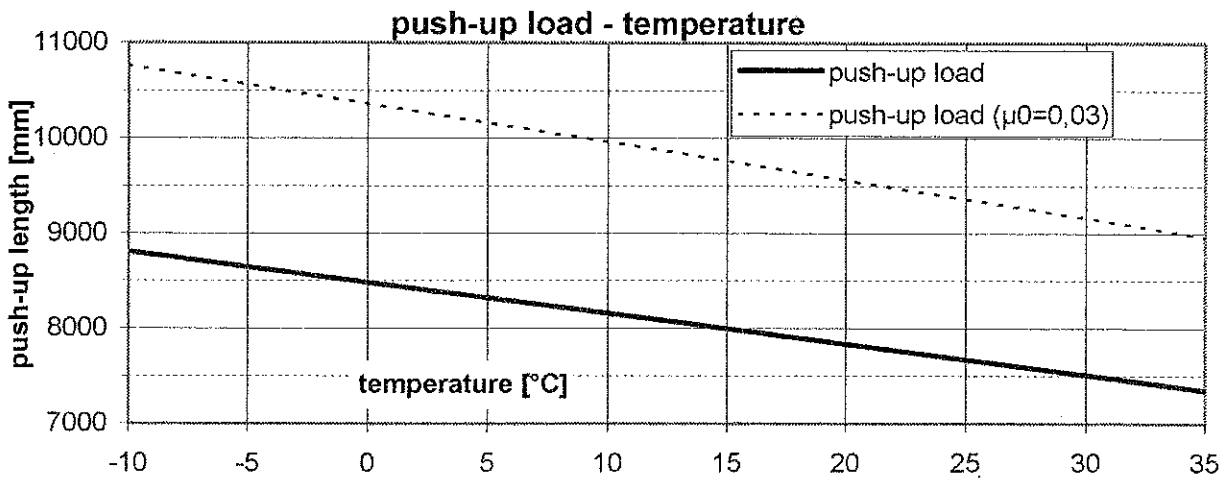

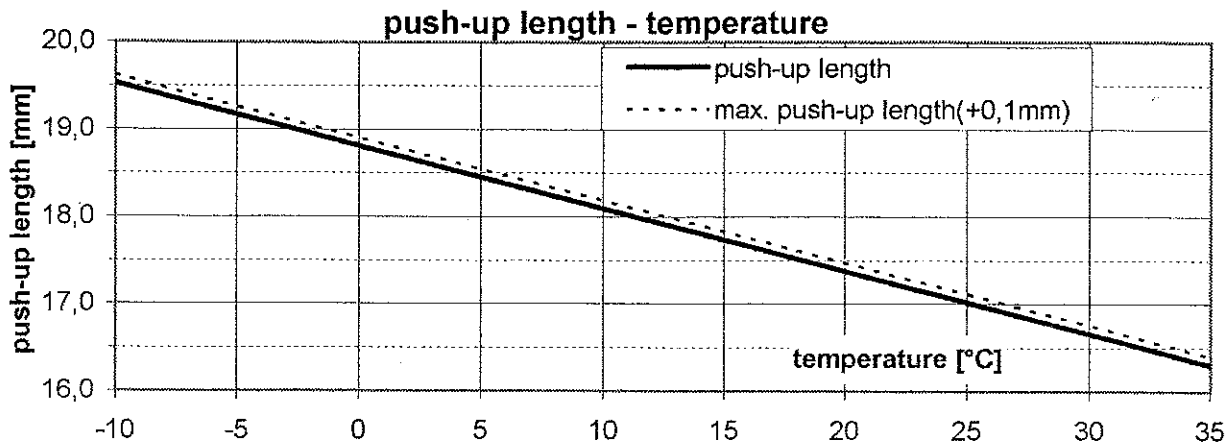

COMMENTS:

THE INFORMATIONS GIVEN IN THIS DRAWING ARE ONLY FOR GUIDANCE.

WE RECOMMEND A ONE (AT LEAST) PUSH-UP OF PROPELLER BEFORE THE FINAL ASSEMBLY FOR SMOOTHING OF THE ROUGHNESS PEAKS OF THE CONTACT SURFACES.

THE SURVEYORS OF SHIPOWNER AND CLASSIFICATION SOCIETY SHOULD BE PRESENT DURING THE PUSH-UP OF THE PROPELLER.

		 Klüss

Data and Calculation of Keyless Fitting

propeller draw-no.: 91.1034-6700:01

1. General

The conical connection between propeller and shaft is an keyless oil-hydraulic pressure fitting.

The calculation of the keyless fitting is carried out for service conditions at power output MCR in accordance with the rules of Germanischer Lloyd and the MMG-calculation method.

2. Technical data of the plant

2.1. Propulsion engine

power output-MCR	=	19810	kW
nom. engine speed	=	108	rpm
efficiency of shaft/coupling/gear	η_{SG}	=	1,00
coefficient of pulsating torque	c	=	1,2

2.2. Propeller

propeller thrust-MCR	T	=	1590000	N
propeller speed	=	108	rpm	
shear force at interface	F_v	=	7039204	N

2.3. Material data

	<i>propeller shaft</i> (index "S")			<i>propeller</i> (index "b")			
yield strength	$R_{p0,2S}$	=	290	$R_{p0,2b}$	=	270	N/mm ²
elast. modulus	E_s	=	206010	E_b	=	125000	N/mm ²
poisson's ratio	ν_s	=	0,29	ν_b	=	0,33	
coeff. of linear expansion	α_s	=	1,20E-05	α_b	=	1,80E-05	mm/mm°C

2.4. Geometrical data

nom. hub diameter fore	=	1280	mm
nom. hub diameter aft	=	1180	mm
nom. hub length	=	1330	mm
mean eff. shaft diameter	D_s	=	597,2 mm (see appendix)
mean eff. hub diameter	D_b	=	1231,7 mm (see appendix)
cone	:	1:	20
type of propeller shaft	=	full shaft	
total contact area	A	=	2274615 mm ² (all reductions considered)
eff. contact length	=	1212	mm (all reductions considered)

2.5. Friction coefficients

friction coefficient dry	μ	=	0,13	mm
friction coefficient oil	μ_o	=	0,02	mm

3. Calculation in accordance with the requirement of Germanischer Lloyd for continuous max. loading at MCR without ice impact load

Assumption:

safety in respect of slipping at 35°C S = 2,8

3.1. Calculation of the required unit pressure at t=35°C

$$P_{35,req} = \frac{S * T}{A * B} \left[-S * \Theta + \sqrt{\mu^2 + B * \frac{F_v^2}{T^2}} \right]$$

$$B = \mu^2 - S^2 * \Theta^2 = 0,012 \quad \text{coefficient of shrink fit}$$

$$\Theta = \frac{1}{2} * cone = 0,025 \quad \text{half conicity}$$

$$\boxed{P_{35,req} = 70,5 \text{ N/mm}^2}$$

3.2. Corresponding push up distance at t=35°C

$$\delta_{35,req} = \frac{P_{35,req} * D_s}{2 * \Theta} \left[\frac{1}{E_b} \left(\frac{K^2 + 1}{K^2 - 1} + \nu_b \right) + \frac{1 - \nu_s}{E_s} \right]$$

$$K = \frac{D_b}{D_s} = 2,0625$$

$\delta_{35,req} = 16,0 \text{ mm}$	proposed:	
	$\delta_{35,p} = 16,3 \text{ mm}$	$P_{35,p} = 71,8 \text{ N/mm}^2$

3.3. Corresponding push up distances at t=0°C

$$\delta_t = \delta_{35,p} + \frac{D_s}{2 * \Theta} (\alpha_b - \alpha_s) (35 - t)$$

$$\boxed{\delta_0 = 18,8 \text{ mm}}$$

3.4. Corresponding surface pressure at t=0°C

$$P_t = P_{35,p} \frac{\delta_t}{\delta_{35,p}}$$

$$\boxed{P_0 = 82,9 \text{ N/mm}^2}$$

3.5. Proposed push-up distances at t

table 1:

t [°C]	0	5	10	15	17	20	25	30	35
δp [mm]	18,8	18,4	18,1	17,7	17,6	17,4	17,0	16,7	16,3
P _t [N/mm ²]	82,9	81,3	79,7	78,1	77,5	76,5	75,0	73,4	71,8
W _t [kN]	8482	8320	8158	7997	7932	7835	7674	7512	7350

3.6. Calculation of push up loads at t

$$W_t = A * p_t (\mu_0 + \Theta)$$

results see table 1

3.7. Start point load

$$W = 793 \text{ kN}$$

5. Results

5.1. Maximum pressure at operation condition (t=0°C)

permissible stress	tangential stress	v. Mises stress criterion
$\sigma_{V,perm} = 0,75 * R_{p0,2}$	$\sigma_{LAI} = P_0 * \frac{K^2 + 1}{K^2 - 1}$	$\sigma_V = \sqrt{P_0^2 + \sigma_{LAI}^2} + P_0 * \sigma_{LAI}$
= 202,5 N/mm ²	= 133,8 N/mm ²	= 189,4 N/mm ² < $\sigma_{V,perm}$

5.2. Maximum pressure included the positive tolerance for push-up distance

$$\Delta\delta_{p,t} = 0,1 \text{ mm}$$

see draw.-no.: 94.1034-6700:01, no. 2

$$\sigma_{V,+} = 190,4 \text{ N/mm}^2 < \sigma_{V,perm}$$
